

DRAFT

List of Claims

1-26. (Canceled)

27. (Currently Amended) A method of visually detecting a single copy of the Her-2/neu gene in chromosomal DNA in an intact cell using brightfield microscopy, comprising:

heating the tissue or cell sample sufficiently to dissociate the native chromosomal target strands of Her-2/neu DNA;

contacting said tissue or cell sample with a digoxigenin-labeled nucleic acid Her-2/neu probe specific for the Her-2/neu gene under conditions that allow the re-hybridization of the labeled nucleic acid Her-2/neu probe and target strands of Her-2/neu DNA to form a target-probe duplex;

contacting the target-probe duplex with an anti-digoxigenin antibody under conditions allowing the antibody to bind to the label;

contacting the anti-digoxigenin antibody with an enzyme and a chromogen composition under conditions allowing the development of a visually detectable chromogen substrate signal at each target-probe duplex in the nucleus of the intact cell separate and distinct from the chromogenic signals of other copies of said chromosomal target nucleic acid sequence; and

detecting the chromogenic substrate signal visually using brightfield microscope conditions.

[Note: Support for "nucleus" appears in the specification, for example, at page 17, line 14]

28. (Canceled)

29. (Previously presented) The method of claim 27 wherein the enzyme is selected from the group consisting of a phosphatase and a peroxidase.

30. (Previously presented) The method of claim 27 wherein the chromogen is selected from the group consisting of NBT/BCIP, tetramethylbenzidine and diamino benzidine.
